ASP AUTO SHORE POWER

Applications

The ASP series can be used in a wide range of cost and energy saving applications for a greener world, for example:

- Power management system integration
- Monitor and maintain the vessel always has power
- Maintain important items like battery chargers and refrigerators and freezer are always powered

General description

The ASP family of auto shore power connect monitors shore power 24/7 in the event of power failure to vessel. When AC power returns to the vessel, the ASP will sense the AC power has returned and then automatically turn on the motorized breakers or contactors and connect the AC to the ship's ac distribution buss.

The ASP has two modes of operation controlled by Manual/Auto panel selector switch, in Manual mode the device will go into standby. Once the switch is turned to AUTO the ASP will then energize the electrical panel motorized breakers or contactors. The ASP will then wait for the next power disruption and power return and then start the process again. The ASP will support single AC Buss, split AC Buss and remotely turn on the Shore Power Converter if the vessel is equipped with one.

ASP Family

- ASP-1 AC powered with no support for shore power convertors
- ASP-1-SC AC powered with support for shore power convertors
- ASP-2 DC powered with no support for shore power convertors
- ASP-2-SC DC powered with support for shore power convertors
- ASP-2-SC-AL DC powered with support for shore power convertors and ship AC buss monitor alarm
- Suitable for switchboards, cabinets and for remote locations

Dimensions

6 X 4 X 3 inches 152 x 101 x 76 mm

Whats in the box

The ASP comes complete with controller, relays, fuses and switch with engraved panel
